Dr. Anas Katib

Introduction

Big data describes the large volume of both structured and unstructured data that is so large, it is difficult to process using traditional software techniques. Big Data has the potential to help companies improve operations and make faster, more intelligent decisions because of the competitive market. This data, when captured, formatted, manipulated, stored, and analyzed can help a company to gain useful insight to increase revenues and improve operations.

Hadoop is an open-source software framework used for distributed storage and processing of big data sets using the MapReduce programming model. Hadoop Distributed File System (HDFS) – a distributed file-system that stores data on commodity machines, providing very high aggregate bandwidth across the cluster. HDFS is built to support applications with large data sets, including individual files that reach into the terabytes. It uses a master/slave architecture, with each cluster consisting of a single Name Node that manages file system operations and supporting Data Nodes that manage data storage on individual compute nodes.

Goal of the project

Collection of 100k tweets in JavaScript Object Notation (JSON) format

Find the list of top ten used hashtags in your collection.

Creation of a directory in HDFS for each hashtag from the top ten hashtag list.

Creation of 2 additional directories “Others” and “None”

Store the tweets on files in HDFS

- If a tweet contains a hashtag from the top ten list, store the tweet in that hashtag's directory.

-If a tweet contains one or more hashtags, but none of the hashtags are in the top ten list, store the tweet in the “Others” directory.

-If a tweet does not contain a hashtag, store it in the “None” directory.

Also, Implementation of a function that counts the number of times a keyword appears in one of two tweet JSON attributes (text and hashtags) in all of 12 directories that were created in HDFS

Tools Used

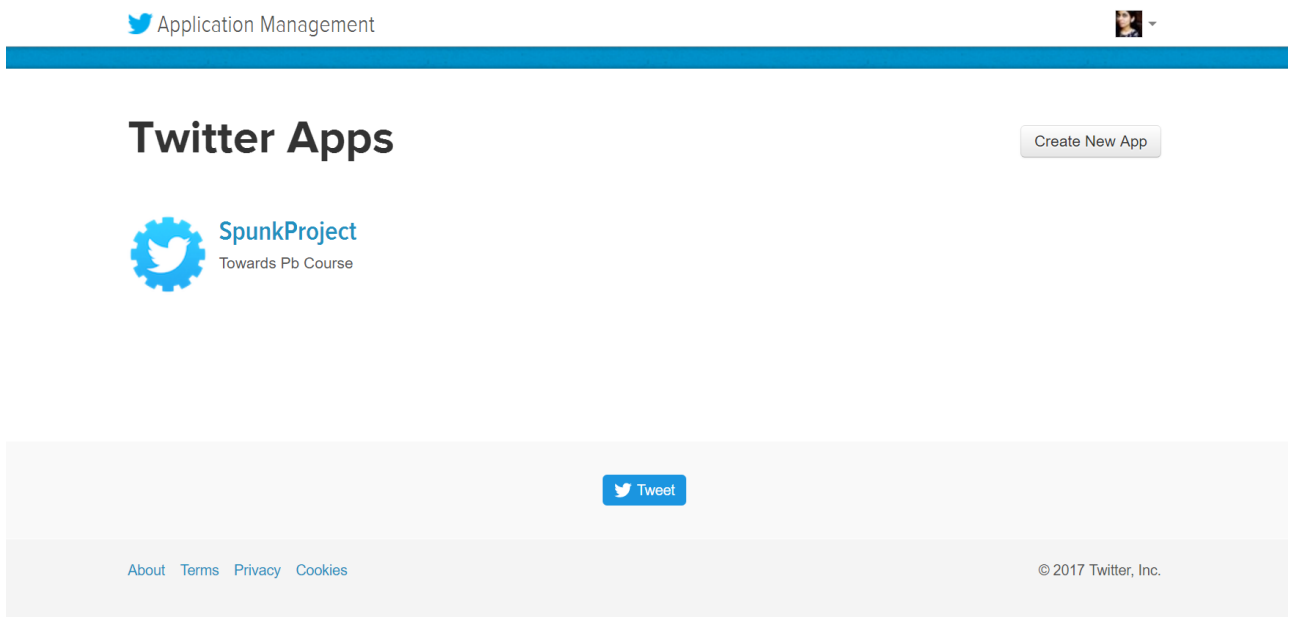

- Python
- Ubuntu 14.04
- Hadoop 2.7.1
- Virtual box
- NetBeans

Implementation

1. Collection of tweets using Python
 - Creation of Twitter Developer account to get access tokens
 - Using Python, we collected the tweets in JSON format with keywords like “Cricket”, “Obama”, “Oscars2017”
 - Converted the tweets into text files
2. Installation of Virtual box and Ubuntu to set the environment
3. Installation of Hadoop
 - Installed Java
 - Installed Scala
 - Installed Spark
4. Start Hadoop
5. Creating directories and store in HDFS files

Output Screenshots

1. Collection of Tweets using Python
- Creation of Dev account to get access tokens

-Python program for tweets collection

```

    stream.filter(track=['obama'])
```

- Tweets Collected

A screenshot of a Notepad++ window titled "C:\Users\mulla\Desktop\tweets4.json - Notepad++". The window displays a JSON file named "tweets2.json" located at "C:\Users\mulla\Desktop\tweets2.json". The JSON content consists of an array of tweet objects. Each object contains fields for "created_at", "id", "id_str", and "text". The tweets are dated "Wed Mar 01 04:50:19 +0000 2017" and "Wed Mar 01 04:50:20 +0000 2017". The text of the tweets includes mentions of @Suntimes, @lynnasweet, @JustSchmeltzer, @ryangrim, @nytimes, @doodhj, @derekahunter, @azalben, @pnehlen, @ramburner1, and @foxnation. The status bar at the bottom indicates the file is a JSON file, has a length of 98,561,900, 52,636 lines, and is using Windows (CR LF) encoding in UTF-8.

```

The image shows a Windows desktop with two applications open. The top application is Notepad++, displaying a Python script. The script starts with a header comment: `Python 2.7.13 (v2.7.13:a0654b1af1, Dec 17 2016, 20:42:59) [MSC v.1500 32 bit (Intel)] on win32`. It includes a copyright notice and a restart command: `RESTART: C:/Users/Pujita/Desktop/tweeey-master/index.py`. The main body of the script consists of a series of JSON objects, each representing a tweet. Each object has the following structure: `{"created_at": "Mon Feb 27 06:07:52 +0000 2017", "id": "836095484691369985", "id_str": "836095484691369985", "text": "RT @bomdialeo: Quem diria que Miss Universo seria v..."}`. The bottom application is VS Code, displaying a JSON file. The JSON file contains a single object: `{ "length": 94,588,166, "lines": 47,628, "Ln": 47,628, "Col": 1, "Sel": 0|0 }`. The status bar at the bottom of VS Code shows the file is named "JSON file", the encoding is "Windows (CR LF)", and the text is in "UTF-8". The Windows taskbar at the bottom shows the Start button, a search bar, and several pinned applications including File Explorer, Edge, and Chrome. The system clock in the bottom right corner shows the time as 12:08 AM on 3/5/2017.

A screenshot of a Windows desktop with a Notepad++ application open. The title bar reads 'C:\Users\mulla\Desktop\tweets2.json - Notepad++'. The menu bar includes File, Edit, Search, View, Encoding, Language, Settings, Tools, Macro, Run, Plugins, and Window. The toolbar contains various icons for file operations and editing. Below the toolbar, there are four tabs: 'tweets2.json' (active), 'tweets1.json', 'tweets3.json', and 'tweets4.json'. The main text area displays a JSON array of tweets. The visible tweets are: 1. The status bar at the bottom shows 'JSON file', 'length: 5,633,882 lines: 2,939', 'Ln: 1 Col: 1 Sel: 0|0', 'Windows (CR LF)', 'UTF-8', and 'INS'. The taskbar at the very bottom shows the Start button, a search bar with 'Ask me anything', and several application icons including File Explorer, Edge, and Chrome. The system clock shows '12:09 AM 3/5/2017'.

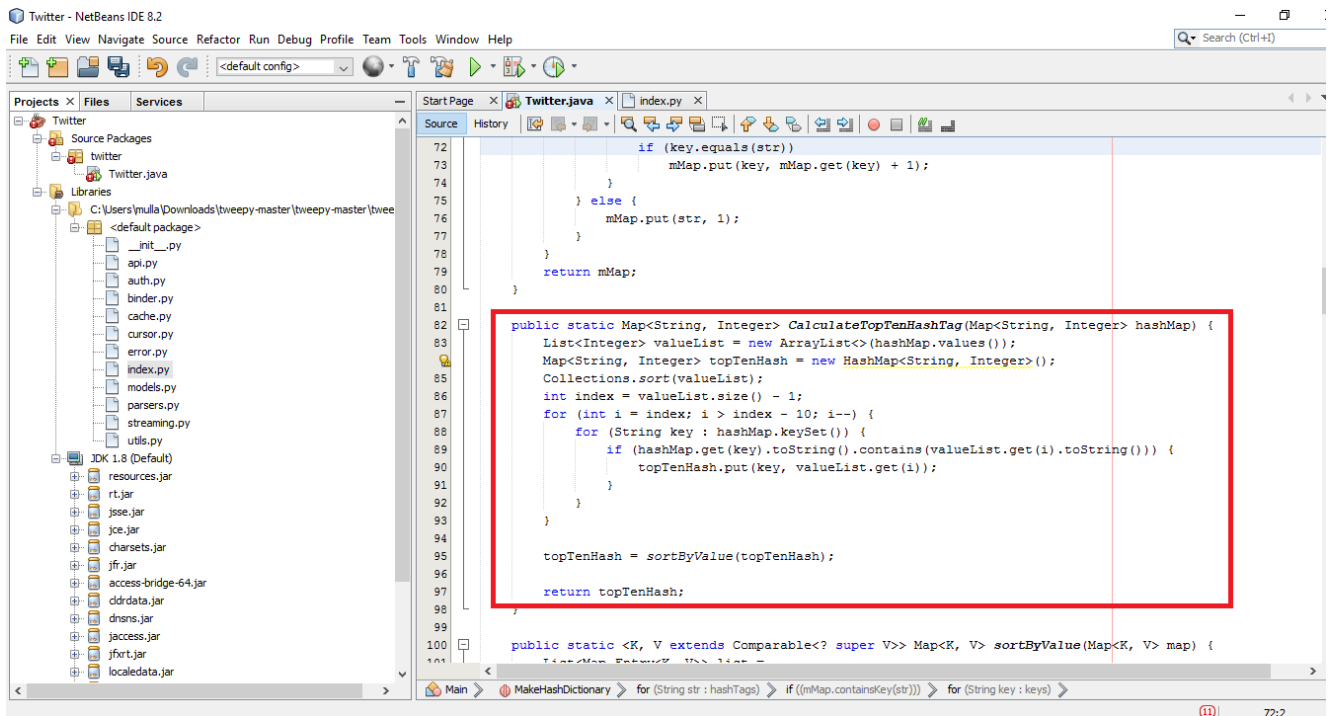

2. Start Hadoop

A terminal window titled 'hduser@ubuntu: ~/hadoop/bin' with a dark purple background and light green text. The window shows the execution of the 'start-all.sh' script to start Hadoop. The output indicates the progress of starting the namenode, datanode, secondarynamenode, jobtracker, and tasktracker, each with its respective log file path. The process is interrupted by a Ctrl-C (^C) command.

```
hduser@ubuntu:~/hadoop/bin$ cd /home/hduser/hadoop/
hduser@ubuntu:~/hadoop$ cd bin
hduser@ubuntu:~/hadoop/bin$ ./start-all.sh
starting namenode, logging to /home/hduser/hadoop/bin/../logs/hadoop-hduser-name
node-ubuntu.out
localhost: starting datanode, logging to /home/hduser/hadoop/bin/../logs/hadoop-
hduser-datanode-ubuntu.out
localhost: starting secondarynamenode, logging to /home/hduser/hadoop/bin/../log
s/hadoop-hduser-secondarynamenode-ubuntu.out
starting jobtracker, logging to /home/hduser/hadoop/bin/../logs/hadoop-hduser-jo
btracker-ubuntu.out
localhost: starting tasktracker, logging to /home/hduser/hadoop/bin/../logs/hado
op-hduser-tasktracker-ubuntu.out
hduser@ubuntu:~/hadoop/bin$ ^C
hduser@ubuntu:~/hadoop/bin$
```

3. Top Ten Hashtags

- Program for top 10 hashtags

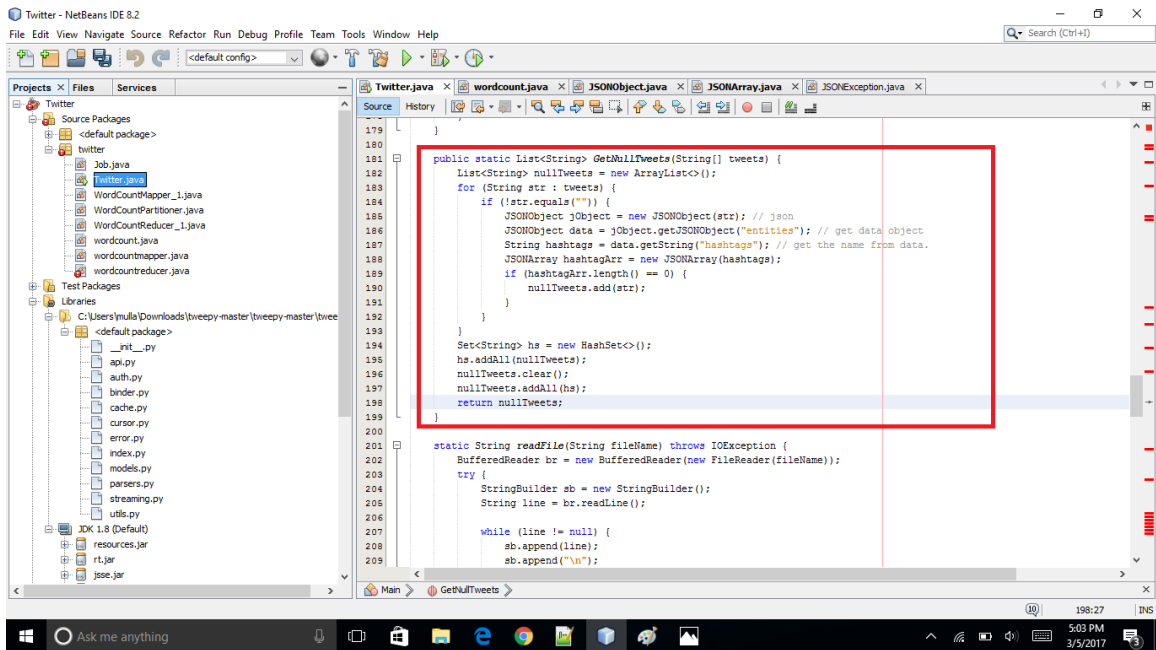

- Output of Top 10 Hashtags

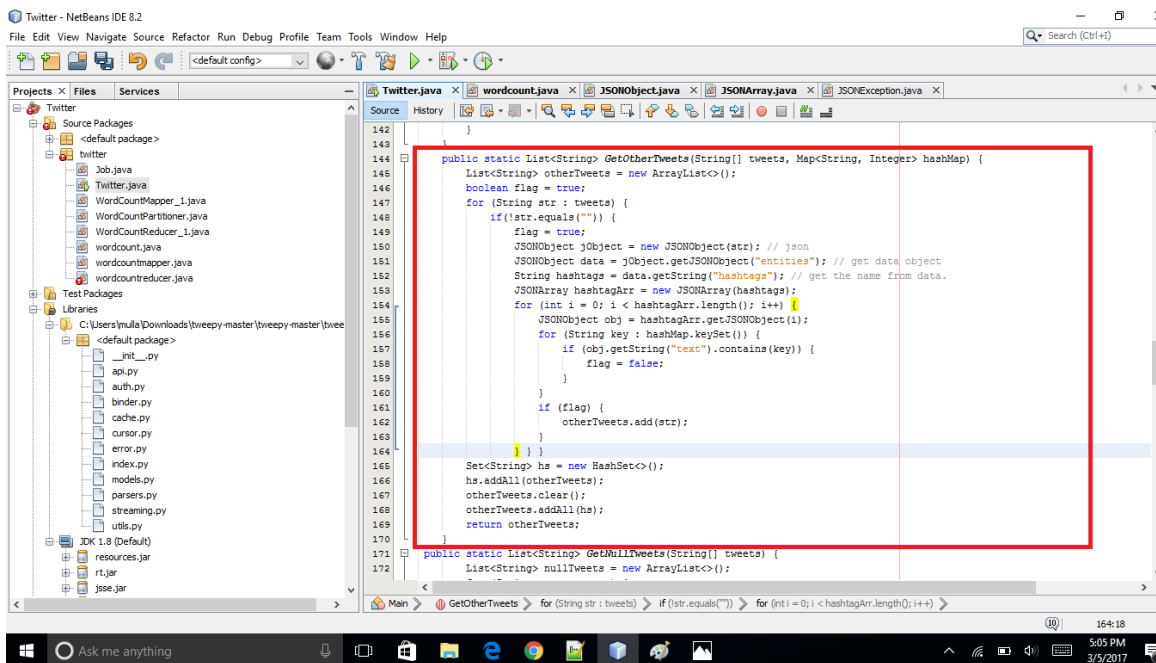

b 'Oscars2017'	1768
b 'Trump'	1600
b 'Oscars'	1434
b 'Virendersehwaq'	1100
b 'Obama'	878
b 'OscarSowhite'	534
b 'Dangrilo'	429
b 'VijayHazare'	376
b 'EmmaStone'	333
b 'Dhoni'	309

4. Program for creating directories

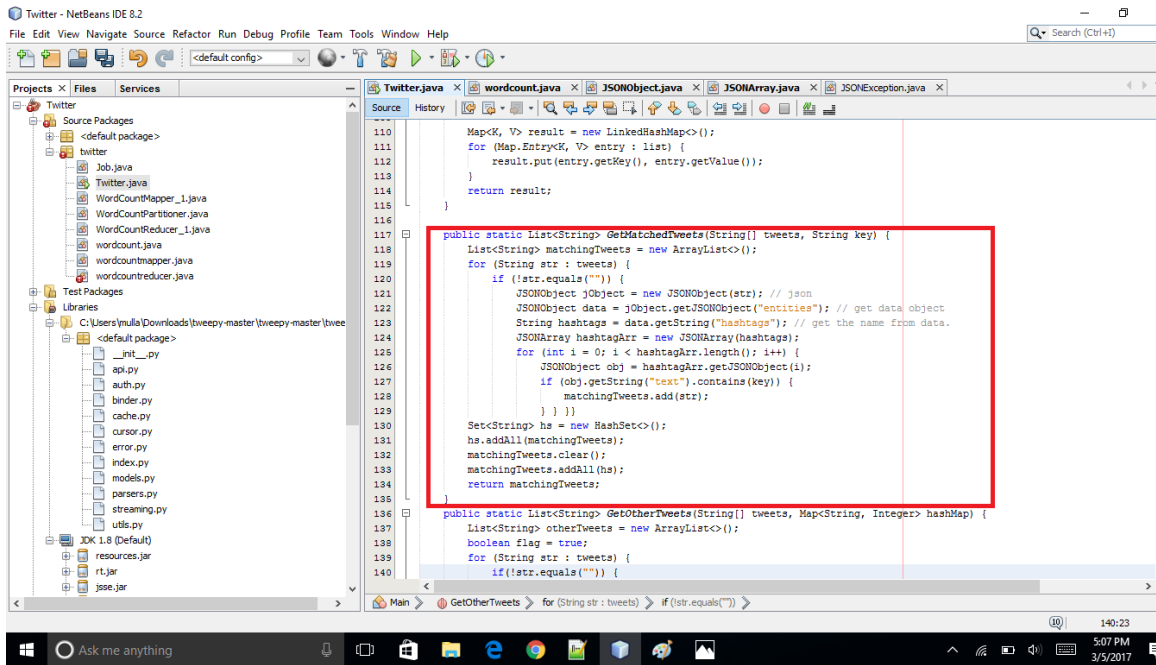

- Null tweets

- Other Tweets

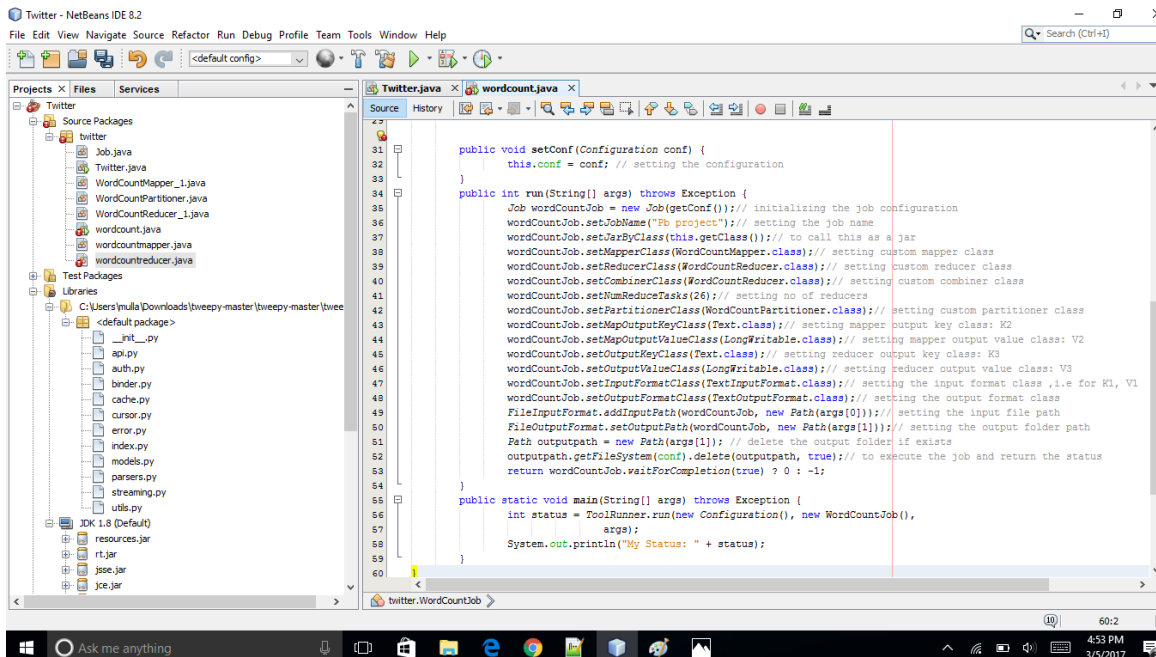

- Matched Tweets

5. Extra Requirement: Word Count

- Word Count Job Program

- Word Count Mapper Function Program

```
// contains the twitter data collection
package twitter
import java.io.IOException;
import org.apache.hadoop.io.LongWritable;
import org.apache.hadoop.io.Text;
import org.apache.hadoop.mapreduce.Mapper;

public class WordCountMapper extends
    Mapper<LongWritable, Text, Text, LongWritable> {
    @Override
    protected void map(LongWritable key, Text value, Context context)
        throws IOException, InterruptedException {
        // Read the line
        String line = value.toString();

        // Split the line into words
        String[] words = line.split(" ");

        // Assign count(1) to each word
        for (String word : words) {
            context.write(new Text(word), new LongWritable(1));
        }
    }
}
```

- Word Count Reduce Function Program

```

1 // contains the twitter data collection
2 package twitter
3 import java.io.IOException;
4 import org.apache.hadoop.io.LongWritable;
5 import org.apache.hadoop.io.Text;
6 import org.apache.hadoop.mapreduce.Reducer;
7
8 public class WordCountReducer extends
9     Reducer<Text, LongWritable, Text, LongWritable> {
10     @Override
11     protected void reduce(Text key, Iterable<LongWritable> values,
12         Context context) throws IOException, InterruptedException {
13         // Sum the List of values
14         long sum = 0;
15         for (LongWritable value : values) {
16             sum = sum + value.get();
17         }
18
19         // Assign Sum to corresponding Word
20         context.write(key, new LongWritable(sum));
21     }
22 }
23
24

```

- Wordcount Sorting
